

A1 Bridge Flue Systems

Draught Breaks and Draught Stabilisers

DRAUGHT BREAKS AND DRAUGHT STABILISERS

Modern day appliances require much more sensitive control of excess draught. At A1 Bridge Flue Systems we have developed a draught break system that offers complete controllability, offering ideal draught conditions at the appliance outlet. Irrespective of the number of appliances connected into a single header system, individual draught requirements can be achieved.

Condensing appliances are particularly sensitive to excess draughts and these units are ideal especially when these appliances are incorporated into flue dilution systems.

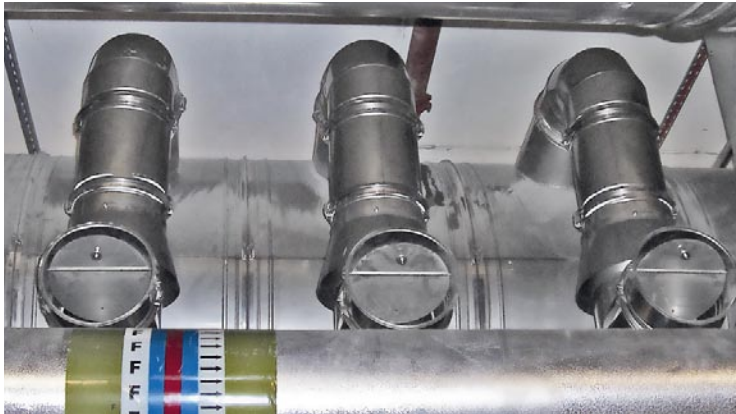

Each of these units incorporates our standard draught stabiliser unit which is still available as an individual item.

All of the above components are manufactured in corrosion-free stainless steel by A1 Bridge Flue Systems to recognised quality standards.

All components are maintenance free and simple to install although **it is recommended that any draught breaks purchased are commissioned for use by A1 Bridge Flue Systems qualified engineers.**

As well as the immediate availability of a wide range of sizes, larger dimensions can be accommodated in custom-made units.

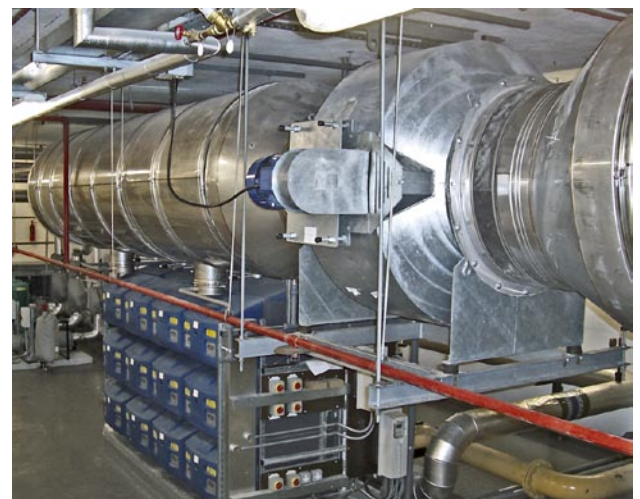

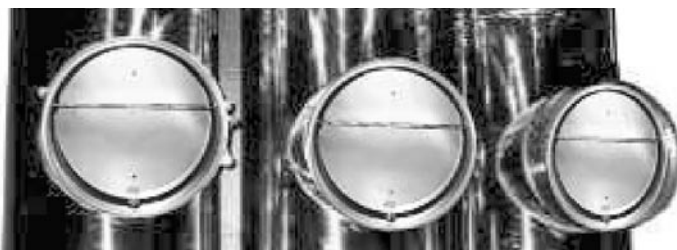

Standard ex-stock sizes start at 150mm (6") rising to 600mm (24") in 25mm increments up to 250mm (10") diameter and 50mm increments thereafter.

Features include:

- All-Stainless Steel
- Corrosion resistant
- Easy to install
- Low maintenance
- Suitable for oil & gas boilers - and condensing boilers
- Meets single or multi - burner requirements
- Ex-stock delivery
- Special sizes quickly made to order

For the best in flue systems, accessories and related products contact A1 Bridge Flue Systems - leading the way in flue technology. A1 Bridge Flue Systems has a wide range of flue systems available and provides a problem solving service to customers from concept to finished installation.

A1 Bridge Flue Systems are long established manufacturers of flue systems supplied throughout the U.K. A1 Flue Systems may be tailor made to suit your exact requirements.

Installations are designed in house by our own design team, operating the latest computer technology.

All flue components are manufactured in our own factory using computer controlled pattern cutting and hand assembly. This allows for efficient production of standard components & specials to be produced often without extended delivery dates.
